Appendix A (Table A1). Fungi used in laboratory experiments and those re-sampled from field plants. Column headings refer to which experiment(s) the fungi were used in. "Lab" designates fungi used in the laboratory experiments with protocorms to assess association with multiple fungi and ability to switch fungi. "Pelotons" (within a root), "Roots" (within a ramet), and "Ramets" (within a genet) designate fungi obtained at the three scales at which we tested for adult association with multiple fungi. Time designates fungi obtained from multiple measurements of adult plants over several years.

Isolate	Sampling Location	Lab	Pelotons	Roots	Ramets	Time
